

ACME Anvils

Asset Discovery

SOC Team

October 22, 2023

It has been brought to our attention that the executives of ACME Anvils are unaware of all devices on the company network.

The goals of this asset discovery will be to:

- Search for all unknown devices on the company network
- Identify all unknown devices on the company network
- Provide a network map visualizing the company's network

Asset Search

During this asset search, the SOC Team of ACME Anvils tested four different zones within the company's network, an External Zone, the Internal LAN Zone, the DMZ, and the SOC Zone. Inside the Internal LAN Zone, eight different hosts were found. These hosts ranged from 192.168.10.1-192.168.10.181. Within the DMZ, nine different hosts were discovered. These hosts within the DMZ ranged from 192.168.20.1-192.168.20.222. Only two machines were found running inside the SOC Zone, being the Consultant Machine and a Flatiron OS. We hope the results found during this asset search give a clear interpretation of ACME Anvils network and what devices are running within said network. Attached will be a new and improved network map of the company's network for further understanding.
